

# MESURFLO AT THE HEART.

## Y-BALL MESURFLO

Of course these piping packages and hose kits are built around the top performing Mesurflo 2500 series of automatic balancing control valves. These are dependable, self flushing, silent balancing valves, the same technology developed for the Navy.

Designed for quiet, trouble free operation in commercial stack buildings, Mesurflo valves maintain a precise, predetermined flow of chilled or heated water across pressure

differential ranges from 2—80 PSID. And Mesurflo automatic balancing valves don't need rebalancing after installation— even if building load patterns should change. Their unique self-flushing design delivers no-clog service, even under conditions that would clog other valves.

At Hays, we have made a science of balancing valves and the piping packages they go into. We are ready to support you by building units that meet your specifications and by bringing you innovations like our flexible packages. All this is to deliver labor savings and factory quality to you and your customers. Think of Hays Fluid Controls when you think of quality balancing valves and piping packages or hose kits.

# TIME IS

# MONEY!

# IMPROVE QUALITY AND SAVE TIME.

## FACTORY BUILT, NOT FIELD ASSEMBLED.

It's cold, maybe it's hot, and your people are connecting another unit to the circulation system. They've lugged their tools and a heavy selection of fittings, couplings and spare parts along with the valves, ATC and balancing valves through the mud and mess to get to this unit to make these connections. Now, on location, they begin to assemble the package and darn, back to the truck for the right tool and a second coupling. Meanwhile, time is passing by. You know this scene like the back of your hand. This is a scene you can kiss goodbye with this time saving money saving solution from Hays Fluid

Controls: Factory-Built Piping Packages. Hays specifications, location coded then shrink wrapped before delivery. Each package can be identified quickly and connected to your system. You simply specify the ATC, the desired flow rate and unit size, then we deliver.

### Hays Mesurflo®

- Operating Range of 2—80 PSID
- Non-Clogging
- Quiet Operation
- Accurate
- Factory Assembled
- Hose Kits and Piping Packages
- Factory Tested

But Hays has added a new twist to save your crews even more time. With our flexible piping package, we have added flexible steel braided hose to aid in a quicker unit connection. The steel braided hose gives your installers more leeway in alignment, eliminating the need to reposition fan coil units or rebuild connection plumbing. Plus flexible packages provide additional vibration attenuation. This simple convenience from Hays simply means more labor savings for you.

With Hays Piping Packages either hard pipe or flexible braided, you get better, factory-built packages for your customer. Packages that meet or exceed their specifications. You install quickly and cleanly, and with our unique flexible braided steel hose, you have fewer field alignment corrections to make those connections. Hays helps you save labor and deliver a better quality job to your customer.
